

Seeking Strategies in Searing Settings

Passively-cooled mid-rise housing

Mark DeKay
Aram Yeretizian
July 2, 2026

Arab speaking cities

Typology of mid-rise

Methodology

Preliminary results

Amman, Jordan

Casablanca, Morocco

Muscat, Oman

Sao Paulo, Brazil

Mumbai, India

Fuzhou, China

Research question

In such cities, common parameters include hot climates, population increase and urbanization. So what characterizes these built environments?

A – Mid rise buildings

B – Housing / residential typology*

C – Construction materials are mainly cementitious

Consequently: in these built environments, what are the opportunities to integrate passive low energy architectural strategies?

***For example, in Cairo alone, 66% of buildings are in the residential sector, i.e. about 9.7 million buildings. (Ref Egypt GBC, BUILD ME Project – Phase II)**

Typology of mid-rise apartment buildings

Beirut

Cairo

Tripoli

Morocco

Amman

Morocco

Characteristics of the typologies

- Vertical circulation and service core
- 6 floors to 15 floors
- Reinforced concrete structure (columns, beams, shear walls, slabs)
- Balconies (terraces, loggias)
- More than one apartment per floor

Opportunities

- Vertical circulation and service core

- 6 –15 floors

- Reinforced concrete structure

- Balconies (terraces, loggias)

- Plan configurations

2 apartments per floor

3 apartments per floor

4 apartments per floor

Different sectional configurations: building heights and street widths

Different sectional configurations: building heights and street widths

Methodology

Mid-rise Residential

Project parameters

IDENTIFY THE CLIMATIC ZONE

IDENTIFY THE PREVAILING WIND-DRIVEN STRATEGIES

ANALYZE SITE TOPOGRAPHY/URBAN CONDITIONS

Effect of Terrain on Wind Velocity Profile

Key points:

In addition to these site environmental priorities, there are several microclimate phenomena that often occur on building sites (Figure 2.11, pp. 41, 42, in Sub-section 2.1.1). The diagrams of the influence of terrain on wind flow patterns (next page) show the potential of wind flow due to a variety of landforms, the part derived from wind tunnel tests (McGowan & Schmitt, 1977, pp. 40, 41).

When wind meets an object like a hill, it creates a high pressure zone of turbulent air on the windward side of the object and a low pressure zone on the leeward side and a low pressure zone of lower velocity on the windward side.

Wind Flow Pattern High to Low Pressure Zone

• SITE IS EXPOSED TO PREVAILING WINDS AND VELOCITY IS ENOUGH

• SITE IS NOT EXPOSED TO PREVAILING WINDS

ASSES OPPORTUNITIES/PROBLEMS RELATED TO SEASONAL/DIURNAL WINDS

Wind flow Procedure for an approximate quantification

Procedure for Daytime cooling

1 - Find the design wind speed at the site ($V_{2,10}$)

2a - The average monthly wind speed at the airport is provided by Climate Consultant, e.g. Beirut

WEATHER DATA SUMMARY

MONTHLY MEANS	JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
Wind speed (m/s)	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5

2b - Calculate the wind speed at the desired building height and terrain (roughness class)

Identify the height of the opening (window or wind catcher or both) within the building

3 - The above values (at 10 meters height) can be checked on the following graph:

Terrain Factor - for heights up to 30 meters, or three floors

4 - Stack ventilation

4a - Assuming the following:

- There are multiple inlet openings
- Indoor temperature is 1.7°C higher than the temperature outside
- The flow rate is $2.4 \text{ m}^3/\text{s}$

Read the area of the stack section from the following graph:

BUILDING
VARIABLES

OUTSIDE GIVEN

- DIRECTIONAL TEST RANGE
- WIND MASS/LOW MASS
- IN-OUT CHARACTER OF CONSTRUCTION MATERIALS (TE, PE, etc.)

OPERATIONS OF THE CAMP

- DAY/NIGHT VARIATIONS
- SEASONAL VARIATIONS

Indoor spaces

Outdoor spaces

Core / vertical circulation

Indoor spaces

Outdoor spaces

Core / vertical circulation

Conclusion

- **The mid-rise housing typology presents numerous opportunities allowing the integration of climate responsive passive cooling strategies.**
- **The commonly used construction materials can be used to increase the efficiency of the strategies.**
- **The flow chart presents a process to integrate the appropriate passive cooling strategies.**

Next steps

- **Fine tune the strategies and create more reliable early design stage assessment methods for the strategies**
- **Study different strategies**
- **Address different building typologies (office, commercial, academic...)**
- **Study potential benefits of having underground levels.**
